**Suggested Citation & Attribution:**

Mandeville, P. B. (2026). Utilities: Manual for Directory Structure (s-DS.R).

**Description:**
This lightweight **R** utility recursively maps the directory hierarchy of a source drive or folder and saves the output to a formatted, dated text file. It allows toggling between a **directory-only view** and a **full file-and-folder view**, while automatically excluding system-level folders like **RECYCLE.BIN** to maximize execution speed and output readability.

## Instructions for Use:

**1. Prerequisites:**
Ensure you have **R** installed along with the **fs** library:

```
install.packages("fs")
```

**2. Configuration & Execution Steps:**

**1. Set Script Parameters:** Configure source path and output detail level.
Open **s-DS.R** and adjust the main configuration options:

- Set **source_dir** to the folder or drive you want to map (e.g., "E:/").
- Set **output_dir** to the destination for report files (e.g., "E:/BackupReports").
- Set **include_files <- FALSE** to list **folders only**, or set **include_files <- TRUE** to list **both folders and individual files**.

**2. Execute the Script:** Run the script directly in your **R** console or **RStudio**.
Run the full script. A message will appear in the console:

```
Scanning drive structure...
```

*(Note: Scanning an entire root drive with **include_files** <- **TRUE** may take a minute or two depending on drive size.)*

**3. Review Generated Output:** Locate the resulting text tree file.
Once execution finishes, open your designated output_dir to find the report file:

- **Folders only:** directory_structure_directories_only_YYYY-MM-DD.txt
- **Folders + Files:** directory_structure_with_files_YYYY-MM-DD.txt
