Mandeville, P. B. (2026). Utilities: Manual for PDF Files (`s-MPDFF.R`).

Description:
This lightweight **R** utility combines two or more **PDF** documents into a single consolidated **PDF** file. Powered by **qpdf**'s native **C++** bindings, it delivers high-performance merging while validating file availability, protecting against accidental file overwrites, and ensuring destination path creation.

Instructions for Use:

1. Prerequisites:
Ensure you have **R** installed along with the **qpdf** and **fs** packages:

```
install.packages(c("qpdf", "fs"))
```

2. Configuration & Execution Steps:

1. Configure File Paths: Set target input documents and output destination.
Open **s-MPDFF.R** and set your file path variables:

- List two or more source **PDF** files in the **pdf_files** vector.
- Set **output_file** to your desired consolidated **PDF** file path.

(Note: Ensure the destination path does not match any of the input file paths.)

2. Check Destination File Locks: Close any open instances of the target **PDF** file.
If the target output file already exists, ensure it is not currently open in Adobe Acrobat, a web browser, or any **PDF** viewer, as Windows file locks will prevent output generation.

3. Execute Merge Process: Run the script directly in **R** or **RStudio**.

Execute the script or call **merge_pdfs(pdf_files, output_file)**. The console will display execution details:

```
Merging 2 PDF files...
Success! Merged PDF saved to:
E:/Personal/Medical/Peter/2026-07-13 HL-Ultrasonido de cuello.pdf
```
