Mandeville, P. B. (2026). Utiliities: Manual for Value Added Between 2 Dates (s-VAB2D.R).

Description:
This financial utility evaluates investment performance across monthly snapshot intervals using the **Modified Dietz** method and **Time-Weighted Return (TWR)** compounding. It computes period-by-period net gains, **Rate of Return** (**RoR**), and **Compound Annual Growth Rate** (**CAGR**), appending an overall summary row for the full date range.

Instructions for Use:

1. Prerequisites:
Ensure the required libraries are installed before executing the script:

```
install.packages(c("dplyr", "readr", "lubridate", "fs"))
```

2. Execution Steps:

1. Configure Analysis Parameters: Specify input history CSV and evaluation dates.
Open **s-VAB2D.R** and set your configuration variables:

- **input_file**: Path to your historical valuation **CSV** (must contain Date, Value, and CashFlow columns).
- **output_file**: Destination **CSV** file path.
- **start_date** and **end_date**: Target date range boundaries (e.g., 2026-01-01 to 2026-08-01).

2. Execute Performance Calculation: Run script in interactive console or pipeline. Source **s-VAB2D.R** in **RStudio** or run it from the console:

```
source("s-VAB2D.R")
```

3. Review Terminal & Output Files: Check cumulative **RoR** and **CAGR** in the console. The script exports **GEF-Results-c.csv** containing itemized monthly intervals along with an "Overall" summary row, while outputting performance metrics to the console:

```
--- Analysis Complete ---
Input File:   GEF-History.csv
Output File:  GEF-Results-c.csv
Overall RoR:  6.45%
Overall CAGR: 9.87%
```
